Biochem, J. 333:795-799(1998).
-!- FUNCTION: PRODUCES NITRIC OXIDE (NO) WHICH IS A MESSENGER MOLECULE WITH DIVERSE FUNCTIONS THROUGHOUT THE BODY.
                                                                                                                                   -!- COFACTOR: HEME. BINDS ONE MOLE EACH OF FAD AND FWN, ALSO REQUIRES TTRAALYTOROBIOPFREIN (BH4) WHICH MAY STABILIZE THE DIMERIC FORM OF THE ENZYME (BY SIMILARITY).
-!- ENZYME REGULATION: REGULATED BY CALCIUM/CALMODULIN (IN CONTRAST
                                                                                                                                                                                                                                                                   -i- SUBUNIT: HOMODIMER (BY SIMILARITY).
-i- TISSUE SPECIFICITY: EXPRESSED IN THE LUNG AND COLON. NOT DETECTED IN THE HEART, AORTA, LIVER, KIDNEY, AND SPLEEN.
-i- INDUCTION: BY LIPOPOLYSACCHARIDE (LPS) IN KIDNEY, SPLEEN, AND COLON. EXPRESSION IS REDUCED IN THE PRESENCE OF LPS IN LUNG.
-i- SIMILARITY: BELONGS TO THE NOS FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                           CATALYTIC ACTIVITY: L-ARGININE + N NADPH + M O(2) = CITRULLINE + NITRIC OXIDE + N NADP(+).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Oxidoreductase; NADP; FAD; FMN; Calcium-binding; Calmodulin-binding;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           30-MAY-2000 (Rel. 39, Last sequence update)

                                                                                                                                                                                                                                                                                                                                                                                                                    in chick embryonic ventricular myocytes.";
Cardiovasc. Res. 38:405-413(1998).
-!- FUNCTION: PRODUCES NITRIC OXIDE (NO) WHICH IS A MESSENGER MOLECULE
WITH DIVERSE FUNCTIONS THROUGHOUT THE BODY. NO MAY SERVE AS BOTH A
PARACRINE AND AUTOCRINE SIGNAL FOR MODULATING OSTEOCLAST BONE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              -1- CATALTIC ACTIVITY: L-ARGININE + N NADPH + M O(2) = CITRULLINE + NITRIC OXIDE + N NADP(+).

-1- COFACTOR: HEME. BINDS ONE MOLE EACH OF FAD AND FMN. ALSO REQUIRES TETRAHYDROBIOPTERIN (BH4) WHICH MAY STABILIZE THE DIMERIC FORM OF THE ENZYME (BY SIMILARITY).

-1- ENZYME REGULATION: NOT STIMULATED BY CALCIUM/CALMODULIN.

-1- SUBUNIT: HOMODIMER (BY SIMILARITY).

-1- INDUCTION: BY TREATMENT WITH LIPOPOLYSACCHARIDES (LPS) OR CYTOKINES, BUT NOT IN OSTBOCLASTS WHERE THEY ARE INDUCED BY CALCIUM AND PMA (PHORBOL 12-MYRISTPATE 13-ACETATE).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CALMODULIN-BINDING (POTENTIAL).

Jr., Zapol D.G., Lepore J.J., Filippov G., Thomas J.E., Jacob H.J., Bloch D.B.;
"Three members of the nitric oxide synthase II gene family (NOS2A, NOS2B, and NOS2C) colocalize to human chromosome 17.";
Genomics 27:526-530(1995).

-! FUNCTION: PRODUCES NITRIC OXIDE (NO) WHICH IS A MESSENGER MOLECULE WITH DIVERSE FUNCTIONS THROUGHOUT THE BODY. IN MACROPHAGES, NO MEDIATES TUMORICIDAL AND BACTERICIDAL ACTIONS.

-! CARALYTIC OXIDE (NO MADPH + M O(2) = CITRULLINE + NUMBER OXIDE).
                                                                                                                                                                                                                                                                                                                                                                                   NITRIC OXIDE + N NADP(+).

-!- CORACTOR: HEME. BINDS ONE MOLE EACH OF FAD AND FMN. ALSO REQUIRES TETRAHYDROBIOPTERIN (BH4) WHICH MAY STABILIZE THE DIMERIC FORM OF THE BNZYME (BY SIMILARITY).

NITRIC-OXIDE SYNTHASE, ENDOTHELIAL (EC 1.14.13.39) (EC-NOS) (NOS, TYPE III) (NOSIII) (ENDOTHELIAL NOS) (CONSTITUTIVE NOS) (CNOS)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             regulated during lung development.";
Am. J. Physiol. 268:L589-L595(1995).
-I- Physiol. 268:L589-L595(1995).
-I- FUNCTION: PRODUCES NITRIC OXIDE (NO) WHICH IS IMPLICATED IN VASCULAR SMOOTH MUSCLE RELAXATION THROUGH A CGMP-MEDIATED SIGNAL TRANSDUCTION PATHANY. NO MEDIATES VASCULAR ENDOTHELIAL GROWTH FACTOR (VEGF)-INDUCED ANGIOGENESIS IN CORONARY VESSELS AND PROMOTES BLOOD CLOTTING THROUGH THE ACTIVATION OF PLATELETS.
-I- CATALYTIC ACTIVITY: L-ARGININE + N NADPH + M O(2) = CITRULLINE + NITRIC OXIDE + N NADP(+).
-I- COFACTOR: HEME: BINDS ONE MOLE EACH OF FAD AND FMN. ALSO REQUIRES TETRAHYDROBIOPTERIN (BH4) WHICH MAY STABILIZE THE DIMERIC FORM OF
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           TISSUE SPECIFICITY: EXPRESSED CONSTITUTIVELY BY VASCULAR BENDYHELLUM. DETECTED IN ALVEOLAR AND SEROSAL EPITHELIAL CELLS AS WELL AS IN ENDOTHELIAL CELLS IN ONE DAY OLD RAT. IN ADULT LUNG, DETECTED IN RENDOTHELIAL CELLS.

DETECTED IN RATGE: DETECTED AT HIGH LEVELS IN LUNG DURING THE LATE FETAL AND POSTNATAL PERIOD AND AT LOWER LEVELS IN ADULT. SIMILARITY: BELONGS TO THE NOS FAMILY.
                                                                                                                                                                                                                                                                                                                                                                         'Downregulation of endothelial nitric oxide synthase (NOS III) in rat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    TRAIN-SPRAGUE-DAWLEY, TESUBE-Lung, MEDLINE-9525090; PubMed-7537461; Kawai N., Bloch D.B., Filippov G., Rabkina D., Suen H.C., Losty P.D., Janssens S.P., Zapol W.M., de la Monte S., Bloch K.D.; "Constitutive endothelial nitric oxide synthase gene expression is

-I- FUNCTION: FUNCTIONS AS A FATTY ACID MONOXYGENASE CATALYSES
HYDROXYLATION OF MEDIUM AND LONG-CHAIN FATTY ACIDS AT OMEGA-1,
OMEGA-2 AND OMEGA-3 POSITICIONS, WITH OPPIMMY CHAIN LENGTHS OF 14-16
CARBONS (LAURIC, MYRASTIC, AND PALMITIC ACIDS). THE REDUCTASE
DOMAIN IS REQUIRED FOR ELECTRON TRANSFER FROM NADP TO CYTOCHROME
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  R InterPro; IPR001433; -.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       2 FERROCYTOCHROME.
-1- COFACTOR: BINDS ONE MOLE BACH OF FAD AND FWN.
-1- SIMILARITY: IN THE N-TERMINAL SECTION; BELONGS TO THE CYTOCHROME P450 FAMILY.
                                                                     "Fatty acid monooxygenation by P450BM-3: product identification and proposed mechanisms for the sequential hydroxylation reactions."; Arch. Blochem. Blophys. 292:20-28(1992).
                                                                                                                                 X-RAY CRYSTALLOGRAPHY (2.0 ANGSTROMS) OF 1-471.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     MICE.";
Am. J. Physiol. 275:H2319-H2324(1998)

-I Physiol. 275:H2319-H2324(1998)

-I Physiol. 275:H2319-H2324(1998)

-I PUNCTION: PRODUCES NITRIC OXIDE (NO) WHICH IS IMPLICATED IN VASCULAR SMOOTH MUSCLE RELAXATION THROUGH A CGMP-MEDIATED SIGNAL TRANSDUCTION PATHWAY. NO MEDIATES VASCULAR ENDOTHELIAL GROWTH FACATOR (VESE). INCORONRY VESSELS AND PROMOTES BLOOD CLOTTING THROUGH THE ACTIVATION OF PLATELETS. MAY PLAY A SIGNIFICANT ROLE IN NORMAL AND ABNORMAL LIMB DEVELOPMENT.

-I CATALYTIC ACTIVITY: L-ARGININE + N NADPH + M O(2) UCITRULLINE + NITRIC OXIDE + N NADP(+).

-I COPACTOR: HEME. BINDS ONE MOLE EACH OF FAD AND FMN. ALSO REQUIRES TETRAHYDROBIOPTERIN (BH4) WHICH MAY STABILIZE THE DIMERIC FORM OF

Hum. Genet. 103:65-69(1998).

-!- FUNCTION: PRODUCES NITRIC OXIDE (NO) WHICH IS IMPLICATED IN VASCULAR SMOOTH MUSCLE RELAXATION THROUGH A CGMP-MEDIATED SIGNAL TRANSDUCTION PATHWAY. NO MEDIATES VASCULAR ENDOTHELIAL GROWTH FACTOR (VEGF)-INDUCED ANGIOGENESIS IN CORONARY VESSELS AND PROMOTES BLOOD CLOTTING THROUGH THE ACTIVATION OF PLATELETS.
-!- CATALYTIC ACTIVITY: L-ARGININE + N NADPH + M O(2) = CITRULLINE +
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sase K., Michel T.;

                                                                                                            This invention describes an immunoassay method where a sample with a specific binding entity (e.g. a monoclonal antibody) reactive to human inducible nitric oxide synthase (iNOS) or mimics of this protein is used to detect the presence of human iNOS protein in the sample. The method can be used for the detection and quantitation of human iNOS in cells and tissues for various pathophysiological conditions such as sepsis, septic shock, myocardial infarction, rejection of tissue in organs following transplantation, monitoring "flare ups" in certain autoimmune diseases such as lupus, psoriasis, and multiple sclerosis.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention describes an immunoassay method where a sample with a specific binding entity (e.g. a monoclonal antibody) reactive to human inducible nitric oxide synchase (iNOS) or mimics of this protein is used to detect the presence of human iNOS protein in the sample. The method can be used for the detection and quantitation of human iNOS in cells and tissues for various pathophysiological conditions such as sepsis, septic shock, myocardial infarction, rejection of tissue in organs following transplantation, monitoring "flare ups" in certain autoimmune diseases such as lupus, psoriasis, and multiple sclerosis. This sequence represents a peptide from human iNOS which is used in the method of the

Inhibition of cytokine mediated immunotoxicity of cells can be achieved by blocking free radical production or the accumulation of free radicals in that cell. Treatment of insulin dependent diabetes mellitus (IDDM) can be achieved by by blocking nitric oxide (NO) production in a pancreatic beta cell and by providing a composition comprising an agent that reduces levels of fatty acids in the cells and protects beta-cells of the subject against lipid-mediated cells and protectil of the subject against lipid-mediated cells. The methods can be used for protecting cells against immunotoxicity mediated by. e. g. IL-1 beta, IL-1 alpha, gamma IFN, IR-7 IL-9, IL-1, IL-7, IL-1, IL-7, IL-1, I

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention describes an immunoassay method where a sample with a specific binding entity (e.g. a monoclonal antibody) reactive to human inducible nitric oxide synthase (iNOS) or mimics of this protein is used to detect the presence of human iNOS protein in the sample. The method can be used for the detection and quantitation of human iNOS in cells and tissues for various pathophysiological conditions such as sepsis, septic shock, myocardial infarction, rejection of tissue in organs following transplantation, monitoring "flare ups" in certain autoimmune diseases such as lupus, psoriasis, and multiple sclerosis. This sequence represents a peptide fragment from human iNOS which is used in the method
                                                                                                                                                                                                                                                                                                                                                                                                                               Inducible nitric oxide synthase; iNOS; human; immunoassay; detection; monoclonal antibody; mimic; quantitation; sepsis; septic shock; lupus; myocardial infarction; tissue rejection; transplantation; psoriasis; autoimmune disease; multiphe sclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

Human chondrocytes were incubated with interleukin-1-beta to induce nitric-oxide-synthase. CDNA was generated and used to construct a library in lambda ZAPII. This was screened with a 650 bp fragment of mouse inducible NO-synthase cDNA to identify the full-length clone pBSHSINOS. The insert was transferred to pSVL to give a vector capable of expressing NO-synthase in CHO cells under control of a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAQ66914 is from human hepatocyte inducible nitric oxide synthase cDNA clone pHINOS from lambda Zap II CDNA library. The original source was induced human hepatocyte RNA. HINOS CDNA plasmid is pref. transformed in E. coli SOLK (ATCC 69126). The inventors claim a clone with the CDNA sequence in AAQ66914 and a CDNA clone which encodes AAR55764. The cloning and expression of a human tissue nitric oxide synthase CDNA provides a source of the enzyme for therapeutic purposes, for example to prevent the hypotensive shock seen with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                 Sequence encoded by the cDNA clone for human hepatocyte inducible nitric oxide synthase.
                                                                                                                                                                                                                                                                                                                                                                                                            cDNA clone encoding human inducible nitric oxide synthase - used to prevent the hypotensive shock seen with sepsis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   tumor;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This protein comprises human penis inducible nitric oxide synthetase (HPINOS). Its amino acid sequence was deduced from a compactone (see AAT98199) derived from human penile smooth muscle cell mRNA. The invention is directed to a method of treating erectile dysfunction in a patient by providing an agent capable of treating erectile dysfunction, and introducing an effective amount of the agent into the penile tissue of the patient. Preferably, the agent induces cavernosal smooth muscle relaxation, and/or produces an increase in the level of NOS in tissue. Preferably, the NOS is iNOS, and the agent is introduced into the corpora cavernosa of the penis. The agent is preferably an NOS inducer, an NOS protein such as HPINOS, a cDNA encoding an NOS such as HPINOS, or CDNA transformed penile cells, especially corpora cavernosa
                                                                                                                                                                                              Gaps
of a cDNA clone (AAT10115) derived from human hepatocytes induced for iNOS biosynthesis. The iNOS can be obtd. by expression of the cDNA e.g. in mammalian host cells and is used in the development of selective inhibitors of NOS or to treat diseases affected by nitric oxide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Treatment of erectile dysfunction - by introducing an agent into penile tissue, particularly for inducing cavernosal smooth muscle relaxation or increasing NOS levels

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The specification describes a method for gene therapy for enhancing and inducing angiogenesis. The method uses a nucleic acid delivery vehicle, which comprises a nucleic acid encoding nitric oxide synthase (NOS). The delivery vehicle is used for the manufacture of a pharmaceutical composition for isolated tissue perfusion treatment. The method is useful for enhancing and/or inducing angiogenesis in patients with endothelial dysfunctions, in particular arteriosclerosis. The present sequence represents an inducible NOS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

This invention describes an immunoassay method where a sample with a specific binding entity (e.g. a monoclonal antibody) reactive to human inducible nitric oxide synthase (iNOS) or minics of this protein is used to detect the presence of human iNOS protein in the sample. The method can be used for the detection and quantitation of human iNOS in cells and tissues for various pathophysiological conditions such as sepsis, septic shock, myocardial infarction, rejection of tissue in organs following transplantation, monitoring "flare ups" in certain autoimmune diseases such as lupus, psoriasis, and multiple sclerosis. This sequence in presents a peptide from human iNOS which is used in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Inducible; nitric oxide synthase; iNOS; human; immunoassay; detection; monoclonal antibody; minic; quantitation; sepsis; septic shock; lupus; myocardial infarction; tissue rejection; transplantation; psoriasis; autofimune disease; multiple sclerosis; epitope mapping.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                Detection of human inducible nitric oxide synthase - using an immunoassay in which a sample is contacted with a specific binding entity reactive with human iNOS or mimics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Detection of human inducible nitric oxide synthase - using an · immunoassay in which a sample is contacted with a specific binding entity reactive with human iNOS or mimics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

                                         This invention describes an immunoassay method where a sample with a specific binding entity (e.g. a monoclonal antibody) readtive to human inducible nitric oxide synthase (iNOS) or mimics of this protein is used to detect the presence of human iNOS protein in the sample. The method can be used for the detection and quantitation of human iNOS in cells and tissues for various pathophysiological conditions such as sepsis, septic shock, myocardial infarction, rejection of tissue in organs following such as lupus, psoriasis, and multiple sclerosis. This sequence represents a peptide from human iNOS which is used in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   specific binding entity (e.g. a monoclonal antibody) reactive to human inducible nitric oxide synthase (inNS) or minics of this protein is used to detect the presence of human iNOS protein in the sample. The method can be used for the detection and quantitation of human iNOS in cells and

The method can be used for the detection and quantitation of human iNOS in cells and tissues for various pathophysiological conditions such as sepsis, septic shock, myocardial infarction, rejection of tissue in organs following transplantation, monitoring "flare ups" in certain autoimmune diseases such as lupus, psoriasis, and multiple sclerosis. This sequence
tissues for various pathophysiological conditions such as sepsis, septic shock, myocardial infarction, rejection of tissue in organs following transplantation, monitoring "flare ups" in certain autoimmune diseases such as lupus, psoriasis, and multiple sclerosis. This sequence represents a peptide from human iNOS which is used in the method of the

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Description

-!- FUNCTION: PPIASES ACCELERATE THE FOLDING OF PROTEINS.
-!- CATALYTIC ACTIVITY: CIS-TRANS ISOMERIZATION OF PROLINE IMIDIC PEPTIDE BONDS IN OLIGOPEPTIDES.
-!- ENZYME REGULATION: INHIBITED BY CYCLOSPORIN A (CSA).
-!- SIMILARITY: BELONGS TO THE CYCLOPHILIN-TYPE PPIASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

TISSUE SPECIFICITY: IN NORMAL KIDNEY, EXPRESSED PRIMARILY IN THE MEDULLARY THICK ASCENDING LIMB, WITH MINOR AMOUNTS IN THE MEDULLARY COLLECTING DUCT AND VASA RECTA BUNDLE.

INDUCTION: BY INTERFERON GAMMA AND LIPOPOLYSACCHARIDE.

SIMILARITY: BELONGS TO THE NOS FAMILY.
A cloning and expression of inducible nitric oxide synthase from vascular smooth muscle cells.";
